TRENDS IN TYPES OF ACCIDENT BY OCCUPATION, 1982-1986

This report shows trends in types of accidents by occupation for the period 1982-1986. It shows, for individual occupations, what the most commonly occurring accident categories were and whether there has been any change in these categories over the period 1982-1986. The claim counts shown for each year are the number of wage-loss injuries that occurred in the year and were accepted by the end of the first quarter of the following year.[1]

Table 1 shows annual claim counts for broad occupational categories. The categories are the major groups from the OCM (1971) occupational coding system. The major groups are defined by the first two digits of the four digits in the code. The OCM coding system is used by the BC Board and the other Canadian Boards as part of the National Work Injuries Statistics Program.

Table 2 shows annual claim counts for more detailed occupational categories. The categories are the minor groups from the OCM, defined by the first three digits of the code. Minor groups with small claim counts are not shown in Table 2.

Table 4 constitutes the main part of this report. It shows information for the most detailed OCM occupational categories, those that use all four digits of the code. There are 107 pages in Table 4, one for each of the 107 four-digit occupations for which there were at least 100 wage-loss injuries in 1983.

---

[1] Claim counts in the annual report are on a different basis. The annual report shows claims accepted in the year regardless of year of injury.

Table 3 is a table of contents for Table 4; it lists the 107 four-digit occupations tabulated in Table 4. The information shown in Table 4 for each occupation is a breakdown of claim counts by year and accident category. The accident categories are based on the Type-of-Accident and Source-of-Injury codes that are part of the National Work Injuries Statistics Program.

As an illustration of the four-digit structure of the OCM Occupation Code, we note the first entry in Table 4, occupation 2733. This occupation is part of minor group 273 in Table 2, and is part of major group 27 in Table 1.

The information in Tables 1 and 2 shows that the injury count has remained fairly stable between 1982 and 1986 for most occupational categories. One exception is the Construction Trades category, where there has been a decline in the number of wage-loss injuries from 11,389 in 1982 to 7,899 in 1986. This decline is mainly due to a decrease in construction employment over that period.

As examples of the kind of information that can be gleaned from Table 4, we consider the first two occupations: 2733, Secondary School Teachers, and 3131, Nurses. In the case of Secondary School Teachers, the claim count peaked in 1982 and has since declined. The pattern of injuries has remained relatively stable. The two largest accident categories have been "slips and falls on the same level" and "bending, reaching, repetitive motion". In the case of Nurses, the claim count increased steadily throughout the 1982-1986 period. The pattern of injuries was again relatively stable. The main

accident category for Nurses has been "overexertion from handling patients", which accounts for more than half the claims from Nurses.

Compulsory WCB coverage of farmworkers began in April 1983. Therefore, the 1982 claim count for occupation 7182, which reflects only farmworkers covered under optional protection, and the 1983 count, which reflects farmworkers covered under a mixture of the two policies, are not comparable to the 1984, 1985 and 1986 counts for occupation 7182.
